

Case Study

Bell Helicopter

WebEVM™ helps world's premier provider of vertical lift aircraft streamline their Earned Value Management Process

"WebEVM's technology combined with our Premier reporting and analytics software meets our enterprise-wide, multi-project EVM needs."

Tim West, Director of EVMS,
Bell Helicopter

The Challenge

After Bell Helicopter invested in re-certifying its EVM across the enterprise, the need to increase the efficiency of its Project Management and Earned Value Compliance functions became abundantly clear - and critical to not only staying competitive but to maximizing the quality and profit potential of hundreds of concurrent programs.

Bell was seeking proven technologies to integrate with their existing web-based, analytics and reporting software and to further automate their processes.

Their search led them to require a technology solution to seamlessly integrate with their existing software without a huge learning curve and unnecessary overhead.

The Solution

Bell transitioned to WebEVM and WebEVM's Web Services as their EVMS. Bell was able to extend their automated EVM processes and streamline the process using WebEVM Web Services. WebEVM's Web Service functionality was critical to the speed and simplification of the implementation. It also ensures future enhancements and integrations will yield the same level of success.

WebEVM Web Services allow Bell Helicopter to easily process and manage its large and complex data structures. WebEVM Web Services provides seamless connectivity to their external systems.

Additionally, Bell Helicopter has benefited from a web based solution that provides immediate updates to any changes in the EIA-748 requirements. The enterprise data also ensures every user has access to the same information.

The aerospace/DoD enterprise believes analytic and reporting responsibility for multiple projects must be parsed across many EVM professionals to have the "horsepower" to meet monthly PM and EVM compliance requirements. In contrast Bell utilized WebEVM to leverage it's functionality to reduce the data processing cycle 80%.

Think Different. Work Different. Do More.
